# Azure Functions

Platform Evolution  
Serverless

# The “evolution” of application platforms

# What is Serverless?

Abstraction  
of servers

Event-driven/  
instant scale

Micro-billing

# Benefits of Serverless

Reduced  
DevOps

Focus on  
business logic

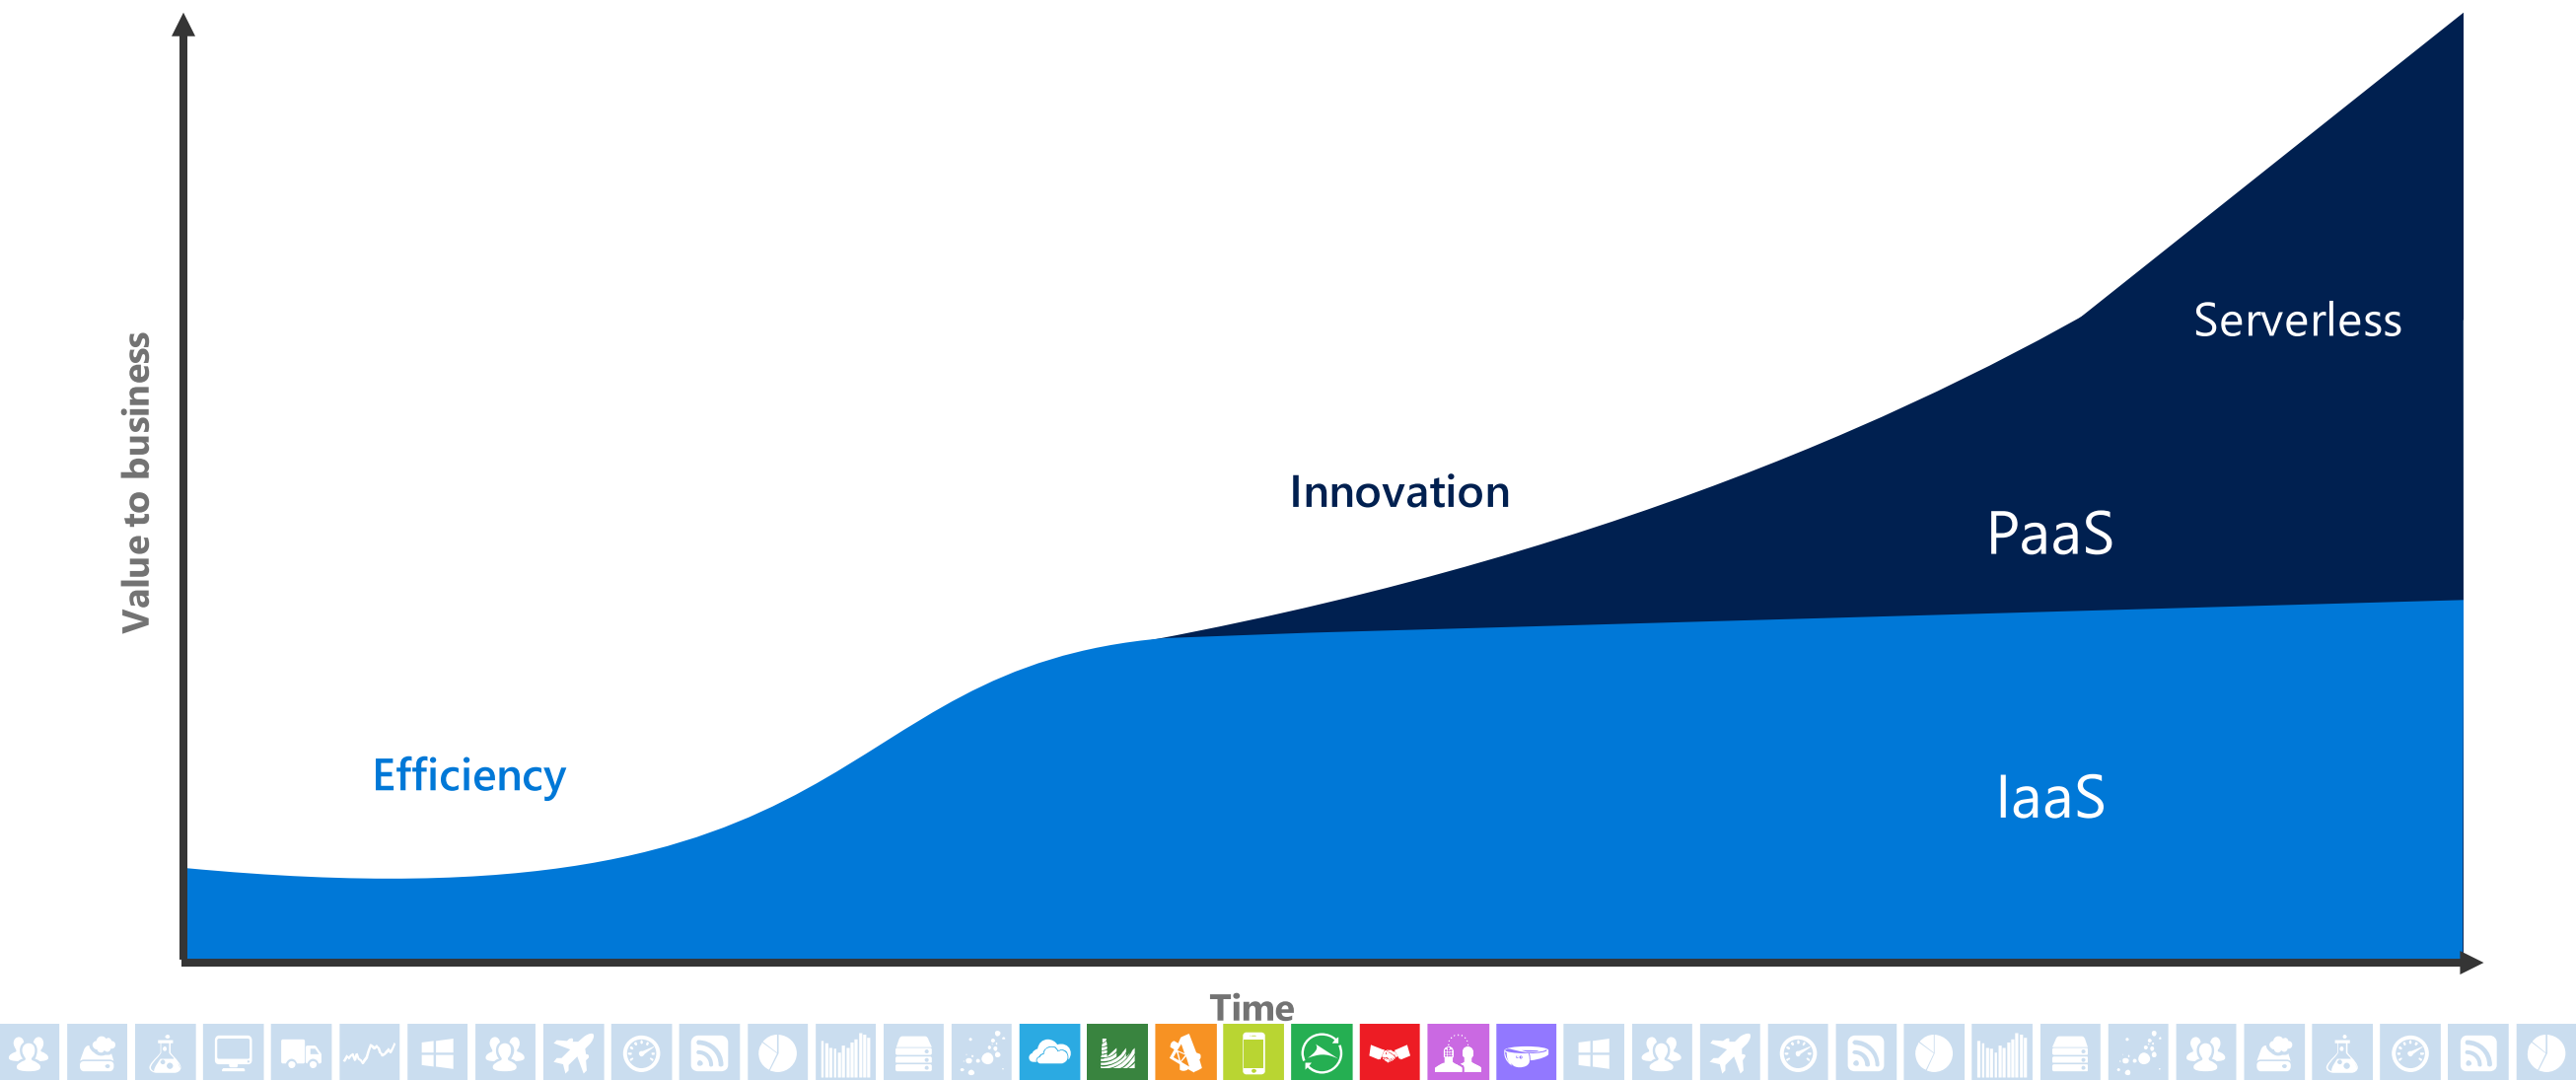

Faster time to  
market

# Build apps faster with Serverless

# Azure Durable Functions

Serverless  
Stateful  
Long-running  
Development  
Deployment  
Monitoring

# Job Sequence

```
[FunctionName("Function1")]  
public static async Task<List<string>> RunOrchestrator1(  
    [OrchestrationTrigger] IDurableOrchestrationContext context)  
{  
    var outputs = new List<string>();  
  
    outputs.Add(await context.CallActivityAsync<string>("ExecuteJob", "Arg1"));  
    outputs.Add(await context.CallActivityAsync<string>("ExecuteJob", "Arg2"));  
    outputs.Add(await context.CallActivityAsync<string>("ExecuteJob", "Arg3"));  
  
    return outputs;  
}
```

# Fan-out Fan-In

```
[FunctionName("Function2")]
public static async Task<List<string>> RunOrchestrator2(
    [OrchestrationTrigger] IDurableOrchestrationContext context)
{
    var tasks = new Task<string>[3];

    var outputs = new List<string>();

    // Replace "hello" with the name of your Durable Activity Function.
    tasks[0] = context.CallActivityAsync<string>("ExecuteJob", "Arg1");
    tasks[1] = context.CallActivityAsync<string>("ExecuteJob", "Arg2");
    tasks[2] = context.CallActivityAsync<string>("ExecuteJob", "Arg3");

    await Task.WhenAll(tasks);

    outputs.Add(tasks[0].Result);
    outputs.Add(tasks[1].Result);
    outputs.Add(tasks[2].Result);

    return outputs;
}
```

Even more crazy 😊

# Azure Durable Functions Recap

- Long Running
- Stateful
- Create in VS
- Sequence, fan-in, fan-out and crazy patterns
- Deployment to Azure
- Can run anywhere (On-Prem)
- Can run in docker

# Azure Container Instances

Create Docker Image  
Push image to registry  
Run in ACI

# Create docker image

```
> docker login -u name -p *** name.azurecr.io
```

```
> docker tag dockerconsole:bla damir.azurecr.io/dockerconsole:latest
```

```
> docker push name.azurecr.io/dockerconsole:latest
```

# Run image in ACI

```
az container create
--resource-group RG-DURABLEDELME --name name
--cpu 4 --memory 6
--image damir.azurecr.io/dockerconsole:latest
--registry-username username --registry-password "***"
--restart-policy Never
--environment-variables Arg1="ENV1" Arg2="ENV2"
```

# Deploy Image from the Azure Function

Image is already published to registry  
Write code to deploy image  
Write code to track image execution

# Deploying Docker Images

Nuget package: **Microsoft.Azure.Management.Fluent**

# Create the Principal for Deployment

```
az ad sp create-for-rbac -n "principalname"  
--role owner  
--scopes subscriptions/$subscriptionId/resourceGroups/$rg
```
